

Web Application Development Practical 6: JavaScript and JSON

WYSIWYG Editors such as MS FrontPage, Dreamweaver, etc., should not be used during the practical. An editor such as Notepad/TextEdit or Brackets should be used to edit the HTML.

The aim in this practical is to work with several JSON files using JavaScript.

The files from Lecture 11 on JSON include the sample files:

- Color data: **colorData.json**
- Customer data example: **customerData.json**
- YouTube response: **youtube.json**

Please refer to Lecture 11 for details of how to read in a JSON file using JavaScript. Your task is to display the JSON data in the above files in a webpage. Create one html page for each JSON file.
